HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Strain gradient elasticity theory

$$w = w(\boldsymbol{\varepsilon}, \nabla \boldsymbol{\varepsilon})$$

strain energy density

strain

strain gradient

Strain gradient elasticity theory

$$w = w(\boldsymbol{\varepsilon}, \nabla \boldsymbol{\varepsilon})$$

Stress gradient elasticity theory

$$w^* = w^*(\boldsymbol{\sigma}, \nabla \boldsymbol{\sigma})$$

stress energy density

stress

stress gradient

Strain gradient elasticity theory

$$w = w(\boldsymbol{\varepsilon}, \nabla \boldsymbol{\varepsilon})$$

Stress gradient elasticity theory

$$w^* = w^*(\boldsymbol{\sigma}, \nabla \boldsymbol{\sigma})$$

Is stress gradient elasticity **equivalent** or **complementary** to strain gradient elasticity?

- ? How does stress gradient elasticity theory (Forest and Sab, 2012) differ from strain gradient one?
- Stress gradient elasticity theory (Forest and Sab, 2012).
- Closed form solution to Eshelby spherical inhomogeneity problem.
- Homogenization of heterogeneous stress-gradient materials (Mori Tanaka estimate)

Decomposition of stress gradient tensor

The spherical and deviatoric part of a third order tensor

Strain gradient tensor

- "free"

Stress gradient tensor

- constrained

$$\nabla \cdot \sigma + \mathbf{b} = 0 \Leftrightarrow (\nabla \sigma) : \delta + \mathbf{b} = 0$$

Decomposition of stress gradient tensor

$$\nabla \sigma = \mathbf{J} \therefore \nabla \sigma + \mathbf{K} \therefore \nabla \sigma$$

spherical projector

deviatoric projector

$$J_{ijklmn} = \frac{1}{8} (\delta_{ik}\delta_{jl}\delta_{mn} + \delta_{ik}\delta_{jm}\delta_{ln} + \delta_{il}\delta_{jk}\delta_{mn} + \delta_{im}\delta_{jk}\delta_{ln})$$

$$K_{ijklmn} = I_{ijklmn} - J_{ijklmn}$$

Stress energy density function

$$w^* = w^*(\boldsymbol{\sigma}, \underbrace{\mathbf{K} \therefore \nabla \boldsymbol{\sigma}}_{\mathbf{R}})$$

For isotropic stress gradient materials:

$$w^*(\boldsymbol{\sigma}, \mathbf{R}) = \frac{1}{2} \boldsymbol{\sigma} : \mathbf{S} : \boldsymbol{\sigma} + \frac{1}{2} \mathbf{R} \therefore \mathbf{M} \therefore \mathbf{R}$$

Constitutive laws

$$\mathbf{e} = \frac{\partial w^*}{\partial \boldsymbol{\sigma}} = \mathbf{S} : \boldsymbol{\sigma}, \quad \boldsymbol{\Phi} = \frac{\partial w^*}{\partial \mathbf{R}} = \mathbf{M} \therefore \mathbf{R}$$

NOTA: $\boldsymbol{\Phi}, \mathbf{R}$ have to be deviatoric tensors!

$$\mathbf{M} = \mathbf{K} \therefore \mathbf{M} \therefore \mathbf{K}$$

Simplified stress / strain gradient elasticity

A comparison of field equations (no body force)

	Simplified stress gradient	Simplified strain gradient
Equilibrium	$\sigma_{ij,j} = 0$	$\tau_{ij,j} = 0$
Gradient	$R_{ijk} = \sigma_{ij,k}$	$\kappa_{ijk} = \varepsilon_{ij,k}$
Constitutive laws	$e_{ij} = \mathcal{S}_{ijkl}\sigma_{kl}$ $e_{ij} = \varepsilon_{ij} + \Phi_{ijk,k}$ $\Phi_{ijk} = \ell^2 K_{ijkpqr} \mathcal{S}_{pqmn} R_{mnr}$	$\sigma_{ij} = \mathcal{C}_{ijkl}\varepsilon_{kl}$ $\tau_{ij} = \sigma_{ij} - \mu_{ijk,k}$ $\mu_{ijk} = \ell^2 \mathcal{C}_{ijmn} \kappa_{mnk}$
SUBC	$\sigma_{ij} = \Sigma_{ij}$	$\sigma_{ij}n_j - (\mu_{ijk}n_k)_{,j} + (\mu_{ijk}n_k n_l)_{,l}n_j = t_i$ on $\partial\Omega$ (smooth part) $\mu_{ijk}n_j n_k = q_i$ on $\partial\Omega$ (smooth part) $[[\mu_{ijk}m_j n_k]] = 0$ on the edge of $\partial\Omega$

Altan, B.S., Aifantis, E.C., Journal of the Mechanical Behavior of Materials, 8(3), pp. 231–282, 1997

Gao, X.-L., Park, S.K. International Journal of Solids and Structures, 44, pp. 7486–7499, 2007

Eshelby's spherical inhomogeneity problem (1)

Geometry + mechanical properties

Stress gradient (this work):

- Uniform isotropic stress:

$$\Sigma = \mathbf{e}_x \otimes \mathbf{e}_x + \mathbf{e}_y \otimes \mathbf{e}_y + \mathbf{e}_z \otimes \mathbf{e}_z$$

- Uniform axial stress:

$$\Sigma = \mathbf{e}_z \otimes \mathbf{e}_z$$

Strain gradient:

- Gao, X.-L., Ma, H.M Acta Mechanica, 207 (3), pp. 163-181, 2009
- Gao, X.-L., Ma, H.M Journal of the Mechanics and Physics of Solids, 58 (5), pp. 779-797, 2010

Eshelby's spherical inhomogeneity problem (2)

Closed-form solution

Postulated stress form in spherical coordinates (similar to Love's approach)

- Uniform isotropic stress prescribed at boundary:

$$\sigma = \sigma(r)$$

- Uniform axial stress prescribed at boundary:

$$\sigma = \sigma(r, \theta)$$

Continuity conditions at the surface matrix-inclusion

$$\sigma_m(r = a) = \sigma_i(r = a)$$

$$[\mathbf{u} \otimes^s \mathbf{n} + \Phi \cdot \mathbf{n}]_m(r = a) = [\mathbf{u} \otimes^s \mathbf{n} + \Phi \cdot \mathbf{n}]_i(r = a)$$

Love, A.E.H. Dover Publications, New York, 1944

Uniaxial problem $\Sigma = \mathbf{e}_z \otimes \mathbf{e}_z$

Radial stress field $\sigma_{rr}(r, \theta = 0)$

$$\mu_i = 27\mu_m, \nu_i = 0.4, \nu_m = 0.08, \ell_i = \ell_m = \ell$$

Effect of material internal length (1)

Effective shear moduli (Mori Tanaka estimate)

$$\mu_i = 27\mu_m, \nu_i = 0.4, \nu_m = 0.08, \ell_i = \ell_m = \ell$$

Stress gradient is complementary to strain gradient elasticity!

Ma, H.M, Gao, X.-L. Acta Mechanica, 225 (4-5), pp. 1075-1091, 2014

Effect of material internal length (2)

Effective shear moduli: $f = 20\%$

$$\mu_i = 27\mu_m, \nu_i = 0.4, \nu_m = 0.08, \ell_i = \ell_m = \ell$$

- **Stress gradient elasticity: capture size effects.**
- **For $a \gg \ell$, stress gradient effects vanish as expected.**

Softening size effect

... has been reported elsewhere (molecular dynamics simulations)!

To cite some:

- Polyimide matrix "*reinforced*" by silica spherical nanoparticles with various surface treatment.

Odegard, G.M., Clancy, T.C., Gates, T.S. Polymer, 46, pp.553–562, 2005

- Polystyrene matrix "*reinforced*" by silica spherical nanoparticles.

Davydov, D., et al Soft Materials, 12, S142–S151, 2014

- etc

Conclusion

- Solution to Eshelby's spherical inhomogeneity problem
- Mori Tanaka estimate for stress gradient materials
- Stress gradient elasticity differs from strain gradient elasticity
 - Strain gradient: stiffening size effect
 - Stress gradient: softening size effect

Perspective

- Numerical implementation: FEM, FFT
- Physical interpretation of material internal length?

Acknowledgments

- This work has benefited from a French government grant managed by ANR within the frame of the national program Investments for the Future ANR-11-LABX-022-01.

Thank you for your attention!
